Abstract

The venetian blind is movable in a guide on the housing synchronously with a selector lever and has an indicator component with symbols for a selector position display. The blind (4) is made of elastically deformable material and deforms through a material tension counter-directed to the run of the guide. Both ends of the blind which consists of a one-part structure in the central area are inwardly curved and with these ends are arranged in a curvature of the blind guide (5,6) deviating from the tension-free zero position of the blind ends.
